Abstract

A 4-year old girl was admitted to hospital with the main complaint of fever, cough, lost of appetite, and decreased body weight since 6 months. Physical examinations revealed anemic, firm and non tender multiple lymph node enlargements on cervical and axillary's region with dimension of 1x1 cm. There were moist rales and wheezing on both lungs. The abdomen was distended; ascites and edema of extremities were found. Chest x-ray showed diffuse lung infiltrates, cardiothoracic ratio was 51 %. The sequence of events fulfilled the diagnosis of tuberculosis using the criteria of Tuberculosis of Respirology Working-group unless otherwise Fine needle aspiration, PCR and acid-fast bacilli showed no tuberculosis. Further exploration showed fulfillment 6 out of ARA criteria of SLE. Treatment with methyl prednisolon and prednisone resulted in good improvement of symptoms.
