Abstract

This research was aimed to know how the components of Health Belief Model could be used to understand the sexual behavior of street children, thus it could be known the process and the background factors of sexual behavior on the street children. The components used are: perceived susceptibility, perceived severity, perceived benefit, perceived barriers, cues to action, aspect of socio-demographics, and self-efficacy. This research used a qualitative approach particularly in descriptive qualitative. From the specific criteria of sampling was used five representative subjects. Results of this research has shown that the street children are susceptible doing sex because their big curiosity and desire to try the new experiences. They are not aware and assume that their sexual behavior does not have any impact on their self (perceived susceptibility). They also consider that their sexual behaviors are not too excessive and do not have any risk (perceived severity).
