Abstract

Nursing theory of caring in the context of Islamic culture can be interpreted as the nurse facilitates the patient's worship
and in turn, the nurse received a reward from God for this action (Lovering, 2008). Islamic nursing still not fully
implemented in Islamic hospitals. This study aimed to understand the Islamic patients' worship experience.

The method used in this study was phenomenological study. Sample consisted 5 patients and 6 nurses who met inclusion
criteria, recruited by purposive sampling. This study was conducted at Haji General Hospital Surabaya and AisyiahIslamic
Hospital Bojonegoro during August to December 2013. Data were collected by interviewing respondents and analyzed
using the seven step of qualitative data analysis by Collaizi.

The results showed that not all respondents conduct Islamic worship during hospitalization, particularly the obligation
performing prayers five times a day. This is due to physical weaknesses, and feel of uncleanliness. These conditions
were also weakened by the lack of spiritual nursing care by nurses. Nurses had provide patients with prayer
reminder, prayer kit, Qibla direction, wudoo kit, but nurses did not conduct Islamic caring assessment and nursing
diagnosis. Moreover, spiritual nursing process was not documented because of the high workload. Further discussion
about Islamic nursing care and how it is fulfilled is needed. This can be about the best way to introduce worship to
Moslem patients and how to perform it during illness. Nurses should also conduct a proper assessment about the
patient's spiritual needs and implementation of worship and how they want these needs to be helped by nurses.
