Abstract

This study aimed to determine whether there is a negative correlation between self-acceptance with anxiety to face the working world of individual with physical disability. Based on the research, internally individuals with physical disability generally have a low self-acceptance and high anxiety because of their different physical condition. Externally, individuals with physical disability discriminated by public and have limited employment opportunities. Research conducted at UPT Rehabilitasi Sosial Cacat Tubuh Pasuruan between the ages of 21 to 35 years with a number of subjects were 40 people consisting of 24 people are male and 16 women. Data collection tool in the form of self-acceptance questionnaire consisting of 32 items and the anxiety to face the working world consisting of 45 items. Reliability for self-acceptance is 0.788 and 0.901 for anxiety. Data analysis was performed with statistical techniques Product Moment correlation, with the help of SPSS version 16. Based on the analysis of research data obtained by the correlation between self-acceptance with the anxiety at -0.475 with p of 0.001. This suggests that there are negative and significant correlation between self-acceptance with the anxiety to face the working world on the individual with physical disability. That is, the higher self-acceptance, the anxiety facing the lower the working world.
