Analysis of Antenatal Care Visit of Pregnant Mother with Preeclampsia a Health Belief Model Approach

Abstrak:

Introduction: Antenatal care (ANC) is an examination and monitoring of pregnancy to optimize mental and physical health of pregnant women. Visit antenatal care can detect pregnancy complication, including preeclampsia. Preeclampsia is pregnancy disease with hypertension sign, oedema, and proteinuria. Regular
antenatal care will decrease risk or mortally in pregnant woman with preeclampsia. This research was aimed to analyze correlation between antenatal care visit using health belief model approach at Policlinic of Bangil General Hospital. Method: Design
In this study was descriptive analytic. Total sample were 20 pregnant woman with preeclampsia.

This study used independent and dependent variables. Independent variable was component of health belief model. It
consists
of
perceived
susceptibility, perceived
severity, perceived
benefit, perceived
barriers, and cues to action.

Dependent variable was antenatal care visit on pregnant woman with preeclampsia. Data were collected using structured questionnaires and
were analysed using Spearman’s Rho. Result: Results showed that perceived susceptibility have no correlation with regular ANC visit (p = 0.463).

Perceived severity (p = 0.002), perceived benefit (p = 0.014), perceived barrier (0.019), and cues to action factor (p = 0.001). It can be
concluded that health belief model component have correlation to do ANC visit regularly. Discussion: It is recommended to health worker at Policlinic Bangil General Hospital to give adequate information frequently to pregnant woman with preeklamsi. Further studies are needed to analyze the antenatal care visit on
pregnant women with preeclampsia based on the other theories.
